1. Important Basic Information

1.1 Legal Notes

Without prior written consent of Schaltbau GmbH, the instructions is not allowed to be electronically or mechanically reproduced – as a whole or in parts – be distributed, changed, transmitted, translated into another language or used in any other way. Schaltbau GmbH cannot be held liable for damage caused by not observing (or only partly observing) the Installation and installation instructions.

1.2 Conventions for this Installation and Maintenance Instructions

This instructions describe the installation and maintenance of the connectors.

Cross references are presented in *bold italics*.

To highlight particularly important safety instructions and other information, the following symbols are used in this instructions:

**DANGER**

Indicates a hazardous situation with a high level of risk which, if not avoided, will result in death or serious injury.

**WARNING**

Indicates a hazardous situation with a medium level of risk which, if not avoided, could result in death or serious injury.

**CAUTION**

Indicates a hazardous situation with a low level of risk which, if not avoided, may result in minor or moderate injury.

**NOTICE**

Indicates a hazardous situation which, if not avoided, may result in property damage, such as service interruption or damage to equipment or other materials.

**INFO**

Refers to technical features and methods aimed at facilitating work or to particularly important information.

2. General and Security Information

2.1 Observing the Instructions

- All staff must read and understand the instructions and adhere to them when working with the device.
- Always carefully observe all safety warnings!

2.2 User Obligations

- Observe the respective national instructions and other applicable safety regulations for the use and cable assembly of connectors and connector systems.
- Observe all applicable national provisions, all safety, accident prevention and environmental regulations as well as the recognized technical rules for safe and proper working.
- Carry out regular inspections of all protection and safety devices to see if they work properly.
- Work on electric equipment may only be performed by a qualified electrician or trained personnel working under the direction and supervision of a qualified electrician according to the applicable rules of electrical engineering.
A qualified electrician is a person who can judge and recognise the possible dangers of the jobs commended to him based on his training, knowledge and experience and by knowledge of the appropriate regulations.

Staff must be informed clearly about who is responsible for the maintenance of the connectors.

### 2.3 Intended Use

- The connectors are intended for plug-in and detachable connections of components, devices and systems only. They are used for the transmission of power and signals.
- In order to comply with DIN EN IEC 61984 make sure that always the live side of the connector is fitted with socket contacts.
- Crimp connections have to be manufactured according to DIN EN IEC 60352-2 – Solderless Connections.
- Make sure that there are no undue tensile, pressure, flexing and torsion loads on the connection cable.
- None of the operating conditions defined in our catalogue *F120.en* in section “Specifications”, such as voltages, currents, ambient conditions, etc. may be changed.
- Work on the connectors must only be carried out by staff who meets the requirements set out in these instructions.
- According to DIN EN IEC 61984 connectors used as intended must not be engaged or disengaged when live or under load.
- The connectors must not be contaminated with aggressive media.
- A connector that does not engage easily requires special attention: Check for the correct orientation, pollution or if contacts got bent. Remedy the cause without delay. Never use force! The connector should always engage easily.
- In order to meet the requirements of the protection class and to protect the connectors against the entry of dirt or moisture, make sure that when not mated,
  - the plug is always inserted into a dummy receptacle
  - the hinged lid of receptacles is closed, according to its intended use.
- The connector cables have to be stored / kept properly in the vehicle.
- When disengaging a connector, pull the plug and never the cable.
- Open the hinged lid of the receptacle by an angle of at least 110° but not more than 130°. An over-stretching of the hinged lid may shorten the operational life span of the torsion spring and may damage the hinge mechanism.
- Always close the hinged lid by hand, don’t let it slam.
- Use the connector only according to its intended use. Replace or repair damaged parts exclusively with original parts. Any other usage of or tampering with the connector is considered contrary to its intended use. No liability is assumed for damages and accidents caused due to non-compliance with the instructions or improper use of the connector.

### 2.4 Ambient Conditions

**NOTICE**

The connectors are constructed for specific ambient conditions.

- Operate the connectors only under the ambient conditions, like temperature ranges and IP protection classes as defined in our catalogue *F120.en* in section “Specifications”.

*Note:*

In case of a very low or very high ambient temperature which approximates the limits of the allowable operating temperature range specified in our catalogue *F120.en* in section “Specifications”,

- a higher effort may be needed for the plugging and unplugging and
- the operational life span of plug and coupling receptacle may thus be reduced due to increased wear and tear.
# 3. Dangers and Security Measures

## 3.1 Electrical Dangers

**DANGER**

The connectors contain components that carry voltage. Risk of electric shock!

Always observe the following safety regulations before beginning any work on electrical constructions:

- Disconnect
- Ensure that it is not possible to reconnect unintentionally
- Clearly mark your work area
- Make sure that there is no voltage present
- Earth and short circuit the installation
- Insulate or cover adjacent energized parts
- Only an electrically skilled person may determine if there is no voltage present

**WARNING**

Dirt, moisture, snow and ice in the interior of coupling receptacles or dummy receptacles contaminate the plug. The coupling of a contaminated plug to the coupling receptacle may lead to electric shock, short circuit and damage to the connectors!

- Always check if the interior of the receptacles is free from dirt, moisture, snow and ice before inserting a plug into a coupling receptacle or a dummy receptacle.
- Do not insert a plug into a receptacle when the latter is contaminated, moist or contaminated with snow and ice.
- Remove dirt, moisture, snow and ice without residues from the interior of receptacles and from the plug.
- Never couple a contaminated plug to the coupling receptacle.

## 3.2 Other Dangers

**WARNING**

Exclusively use the connectors for purposes as indicated in the specifications and data sheets. A wrong application can cause accidents and severe damages to persons.

- The manufacturer doesn't take the responsibility for accidents which were caused by improper use of the product.
- We recommend the use of fault current safety systems in constructions with voltages higher than safety extra-low voltage.

**WARNING**

The plugging and disconnecting of the connectors on-load can cause electric arcs. When explosive substances or ignition sources of any kind are nearby, there is a risk of fire and explosion!

- Never plug and disconnect the connectors on-load.
3.3 Mechanical Dangers

**CAUTION**

The connectors contain components that are subject to mechanical stress. There is a risk of crushing!

- Use only appropriate tools for work on the connectors.
- Ensure that components, which are subject to mechanical stress, are secured before installing or dismantling these components.

**CAUTION**

The connectors contain sharp-edged parts. Risk of injury!

- Use only appropriate tools for maintenance work on the connectors.
- Wear protective gloves when working with sharp-edged components.

3.4 Measures for Avoiding Damages

**NOTICE**

Aggressive fluids may damage the connectors.

- Make sure that the connectors are not exposed to aggressive fluids.

**NOTICE**

Improper handling of the connectors, e.g. when hitting the floor with some impact, can result in breakage, bent pin contacts, cracks and deformation.

- Make sure that the connectors are always used properly.
- Regularly sight-check the connectors for potential damages.
- Regularly check the connectors for bent or pushed back contacts.
- Immediately replace damaged components.
3.5 Measures for Avoiding Malfunctions

**NOTICE**

In the case of damage, wear and tear and/or soiling of the connector components - in the form of a partial break, sharp edges and discoloured surfaces - the functional safety of the connectors is no longer guaranteed.

- Carry out regular visual checks to detect wear and tear and dirt.
- Immediately replace damaged parts.
- Immediately remove dirt without leaving any residues.
- Immediately replace parts with stubborn dirt.

**NOTICE**

Inappropriate handling when plugging or disconnecting may damage the connectors. The functional safety of the connectors is no longer guaranteed when parts are damaged.

- Make sure that the guideways and slots of plug and receptacle always interlock when plugging!
- Take care that plug and receptacle do not tilt and that they are plugged without force.
- Make sure before the plugging procedure that plug and receptacle as well as the hinged lid of the receptacle are not contaminated. Remove any existing dirt.
- Make sure that when not mated,
  - the plug is always inserted into a dummy receptacle,
  - the hinged lid of receptacles is closed according to its intended use.

4. Description

4.1 Details

**Break-away connector**

- If installed as intended, the break-away connector guarantees the non-destructive separation of the plug from the receptacle when two vehicles that are not electrically decoupled move away from each other.

**Replacement Insert for receptacles**

- With the 18-pole version in compliance with UIC558, a coupling receptacle is now available which leads to a considerable reduction of the times of maintenance and idleness. In the case of maintenance, you don't have to rewire but only the replacement insert has to be changed. The contact insert can be replaced directly on-site – the lengthy electrical test of contacts and cables is no longer necessary.

**Shell**

- quick and easy to install
- individual components are easy to replace
- seals can be replaced without disassembling the contacts
- Same basic design for empty, coupling and dummy receptacle: empty receptacles are converted to coupling or dummy receptacles by fitting the appropriate contact inserts.

**Cable Assembly**

Connector cables (single and double ended) can be made to customer specifications upon request.

**Technical Information and Material Specifications**

- For technical information and material specifications, see our catalogue catalogue F120.en.
  Download at: schaltbau.info/download1en
4.2 Design

Connectors in the UIC 558 series are 13 or 18-pole connectors to loop through different control signals between railway vehicles. The connectors are in compliance with UIC 558. They connect lines used for:

- remote control of lights
- remote control of doors
- public address system in passenger coaches and traction vehicle
- transmission of binary data

Connectors in the UIC 558 series consist of the following components:

- Connector cable, single ended, in the desired length with cable plugs, single-sided assembly, or connector cable, double ended, with two cable plugs, double-sided assembly.
- Receptacle (consisting of empty receptacle + contact insert with assembled connector cable, single ended, in the desired length)
- Receptacle (consisting of empty receptacle + replacement insert and crimp adapter with assembled connector cable, single ended, in the desired length)
- Dummy receptacle (consisting of empty receptacle + contact insert unpopulated; for the insertion of a non-coupled cable plug)
- Full customer-specific cable sets

Contact inserts for 13 and 18 contacts in compliance with UIC 558 as well as 22 contacts + PE for other applications and customer-specific contact arrangements are available.

5. Installation

**DANGER**
The connectors contain components that carry voltage. Risk of electric shock! Always observe the following safety regulations before beginning any work on electrical constructions:

- Disconnect
- Ensure that it is not possible to reconnect unintentionally
- Clearly mark your work area
- Make sure that there is no voltage present
- Earth and short circuit the installation
- Insulate or cover adjacent energized parts
- Only an electrically skilled person may determine if there is no voltage present

**NOTICE**
During installation, ensure that dirt caused by surrounding construction activities does not get into the connectors.

5.1 Check Parts for Transport Damage

**NOTICE**
If parts are damaged, the functional reliability of the connectors is no longer given.

- Before installing, check all parts for any possible transport damage.
- Do not install any damaged parts.

5.2 Dimensions/Interfaces to the Vehicle

The dimensions to the interfaces of the vehicle are given in the respective data sheets or in our catalogue F120.en. (Download: schaltbau.info/download1en)

5.3 Installing Coupling Receptacles

**Preliminaries**
The assembly has to be carried out by qualified trained personnel.

**Correct mounting position**
The break-away connector function guarantees a non-destructive separation of plug and receptacle when two electrically not uncoupled vehicles move away from each other. For this purpose, the mounting position of the coupling receptacle must be performed in compliance with UIC 558 VE in order to guarantee the prescribed tensile forces / directions on the flexible cable. Fig. 4/D shows an example: Vertical mounting position, lid opening to the top.

Moreover, a mounting position up to an angle of max. 90° clockwise is possible for coupling receptacles. In this instance, the lid must show downward (for examples refer to Fig. 4/E and F).

**NOTICE**
An installation of the coupling receptacle with lid showing upward (refer to Fig. 4/G) is not permissible! When the lid is open in this mounting position, contamination and moisture might penetrate the contacts and accumulate there during the plugging procedure or in the plugged condition. Moreover, this mounting position causes a not definable limitation of the prescribed tensile forces / directions on the flexible cable and thus on the contact retainer and locking mechanism. In this mounting position, the plug connection is strained in transverse direction and the cable causes a unilateral strain on shell, contacts and locking mechanism!

**Requirements to the vehicle wall / mounting surface**
The surface of the vehicle wall / mounting surface must show an average surface roughness Rz of 6.3 … 12.5 μm. The tightening torque for the fastening screws is 10.5 Nm, for screws of steel with strength class 8.8.
Mounting points
The coupling receptacle is fastened with 3 cylinder screws M6 or alternatively with 4 cylinder screws M6.
The tightening torque (10.5 Nm for screws of steel with strength class 8.8) and the length of the fastening screws must be determined by the manufacturer of the vehicles depending on the structural conditions.

Two possibilities of installation are available for coupling receptacles:
- Installation with socket insert and completely assembled connector cable (13-, 18-pole)
- Installation with a replacement insert and completely assembled crimp adapter (18-pole)

5.4 Coupling Receptacles with Socket Insert and Assembled Connector Cable

1. Thread the O-ring (3) onto the open end of the connector cable (1).
2. Pull the open end of the connector cable (1) through the prepared mounting hole (max. 40 mm diameter) in the vehicle wall (2).

---

Fig. 5: Mounting points of receptacle
A Mounting points for installation with 3 holes
B Mounting points for installation with 4 holes
C Earthing bolt M6 (only special design F4)

The dimensions and arrangement of the mounting holes are shown in Figures 6 and 7.

---

Fig. 6: 3-hole mounting, G = hole for M6 earthing bolt M6 (only for receptacle with special design F4)

Fig. 7: 4-hole mounting
* Diameter for all fixing and securing elements, such as screw heads: 12.5 mm max.
NOTICE

To ensure the proper operation, the socket insert and the contacts may not be under tension.

- Make sure that the specified bending radius is observed when laying the cables: 
  \[8 \times \text{cable diameter} = 145 \, \text{mm}\]
- Slightly fasten the receptacle (5) with the three M6 cylinder screws (or alternatively with four M6 cylinder screws) to the vehicle wall (2).
- Check if the O-ring (3) of the socket insert and rubber seal (lamella ring) (6) are properly in place. Align seals where applicable.
- Adjust all of the parts and fasten the M6 cylinder screws. 
  Tightening torque: 10.5 Nm for screws of steel with strength class 8.8.

Test

- Check that all of the installed parts are in the correct position and function properly.
- Make sure that there are no undue tensile, pressure, flexing and torsion loads on the connection cables.
- Check the functionality of the receptacle lid.

Commissioning

**DANGER**

In the case of a contact of the traction current line with the vehicle, the coupling receptacle may be highly energised. Deadly hazard!

- Before commissioning the receptacle, a high voltage test must be carried out.

- Before commissioning the receptacle, it must be tested in accordance with EN 50215.

5.5 Coupling Receptacles with Replacement Insert, Crimp Adapter and Assembled Connector Cable

- Thread the O-ring (7) onto the open end of the connector cable (1) and slide it onto the crimp adapter (8).
- Pull the open end of the connector cable (1) through the prepared mounting hole (max. 40 mm diameter) in the vehicle wall (2).
- Attach the O-ring (3) to the replacement insert (9).

Test

- Check that all of the installed parts are in the correct position and function properly.
- Make sure that there are no undue tensile, pressure, flexing and torsion loads on the connection cables.
- Check the functionality of the receptacle lid.

Commissioning

**DANGER**

In the case of a contact of the traction current line with the vehicle, the coupling receptacle may be highly energised. Deadly hazard!

- Before commissioning the receptacle, a high voltage test must be carried out.

- Before commissioning the receptacle, it must be tested in accordance with EN 50215.
**NOTICE**

To ensure the proper operation, the socket insert and the contacts may not be under tension.

- Make sure that the specified bending radius is observed when laying the cables:
  
  \[ 8 \times \text{cable diameter} = 145 \text{ mm} \]

- Slightly fasten the receptacle (5) with the three M6 cylinder screws (or alternatively with four M6 cylinder screws) to the vehicle wall (2).

- Check if the two O-rings (3/7) of the replacement insert and crimp adapter as well as the rubber seal (lamella ring) are properly in place. Align seals where applicable.

- Adjust all of the parts and fasten the M6 cylinder screws.
  
  Tightening torque: 10.5 Nm for screws of steel with strength class 8.8.

**5.6 Disassembly of Replacement Insert and Crimp Adapter**

**Special Tools Required**

Pull off tool for pulling off the crimp adapter from the replacement insert, ordering code: UIC DWZ, also refer to chapter „8. Special Tools“.

**Disassembly**

- Dismount the coupling receptacle from the vehicle wall / mounting surface and take it off from the replacement insert.

- Pull the replacement insert (A) with crimp adapter (B) and connector cable (C) out of the interior of the vehicle through the mounting hole in the vehicle wall so that the replacement insert (A) and the crimp adapter (B) are exposed (Fig. 14).

- Take the pull off tool and prepare as follows:
  
  1) Release the 2 screws (D) of the pull off tool until the springs (E) are stress-free (Fig. 15).
  2) Totally unscrew screw (F) so that the clamp of the pull off tool can be opened.

- Then lay the pull off tool around the crimp adapter in such a way that the retaining clips (G) touch the edge of the replacement insert.

- Screw down screw (F) until the pull off tool firmly clasps the crimp adapter.

**Test**

- Check that all of the installed parts are in the correct position and function properly.

- Make sure that there are no undue tensile, pressure, flexing and torsion loads on the connection cables.

- Check the functionality of the receptacle lid.

**Commissioning**

![Fig. 13: Screw coupling receptacle with crimp adapter and replacement insert to vehicle wall](image)

* Diameter for all fixing and securing elements, such as screw heads: 12.5 mm max.

![Fig. 14: Replacement insert (A) with crimp adapter (B) and connector cable (C)](image)

![Fig. 15: Put on pull off tool](image)

In the case of a contact of the traction current line with the vehicle, the coupling receptacle may be highly energised. Deadly hazard!

- Before commissioning the receptacle, a high voltage test must be carried out.

- Before commissioning the receptacle, it must be tested in accordance with EN 50215.
5.7 Installing the Dummy Receptacle

Installation

The dummy receptacle is installed in the same way as the coupling receptacles. The dummy receptacle uses an unpopulated insert without cable and contacts instead of the assembled socket insert with connector cable or replacement insert with crimp adapter.

- Install the dummy receptacle as described under „5.3 Installing Coupling Receptacles“.
- Insert an unpopulated insert instead of the assembled socket insert/replacement insert.

Test

- Check that all of the installed parts are in the correct position and function properly.
- Check the functionality of the receptacle lid.

Commissioning

5.8 Installing Wall-mount Cable Glands for Cable Plugs with Connector Cable

The connector cables have to be installed in such a way that they are free from undue tensile, pressure, flexing and torsion loads.

We recommend using the UIC KK D2 wall-mount cable gland for installation on the vehicle body.

Preparing measures

For the installation of wall-mount cable glands, a mounting hole with 30 mm diameter has to be provided in the vehicle wall.
Installation

**NOTICE**

To ensure the proper operation, the socket insert and the contacts may not be under tension.

- Make sure that the specified bending radius is observed when laying the cables: 8 x cable diameter = 145 mm

- Thread tension screw (G) and strain relief (F) on the open end of the assembled connector cable.

- Lead the connector cable from the outside through the mounting hole (A) (Ø 30 mm) in the vehicle wall (B) to the inside.

- Thread supporting ring (E), spring washer (D) and nut (C) from the inside on the connector cable and attach to the thread of the strain relief (F).

- Screw nut (C) only slightly on the thread of the strain relief (F).

- Adjust all of the parts and fasten nut (C). (Tightening torque: 3 Nm)

- Establish strain relief and screw clamping screw (G) into the strain relief (F). (Tightening torque: 3 Nm)

---

**Test**

- Check that all of the installed parts are in the correct position.

- Make sure that there are no undue tensile, pressure, flexing and torsion loads on the connection cables.

- All contacts must be aligned, i.e. they must not be crooked.

- Make sure the strain relief fits properly.

**Commissioning**

**DANGER**

In the case of a contact of the traction current line with the vehicle, the cable plug with connector cable may be highly energised. Deadly hazard!

- Before commissioning the cable plug with connector cable, a high voltage test must be carried out.

- Before commissioning the plug connection, it must be inspected in accordance with EN 50215.

---

**5.9 Storage of Connector Cables**

When storing double ended connector cables in the carriages or driver’s cabins, make sure the bending radius (based on the cable type) is observed and that the cable is protected against shocks and dirt.
6. Plugging Procedure

For the plugging procedure observe the requirements in chapter "2.3 Intended Use".

**WARNING**

Dirt, moisture, snow and ice in the interior of coupling receptacles or dummy receptacles contami- nate the plug. The coupling of a contaminated plug to the coupling receptacle may lead to electric shock, short circuit and damage to the connectors!

- Always check if the interior of the receptacles is free from dirt, moisture, snow and ice before inserting a plug into a coupling receptacle or a dummy receptacle.
- Do not insert a plug into a receptacle when the latter is contaminated, moist or contaminated with snow and ice.
- Remove dirt, moisture, snow and ice without residues from the interior of receptacles and from the plug.
- Never couple a contaminated plug to the coupling receptacle.

**WARNING**

The plugging and disconnecting of the connectors on-load can cause electric arcs. When explosive substances or ignition sources of any kind are nearby, there is a risk of fire and explosion!

- Never plug and disconnect the connectors on-load.

**CAUTION**

The connectors contain sharp-edged components as well as components which are subject to mechanical tension. Crushing hazard / risk of injury!

- Wear safety gloves when plugging and disconnecting the connectors.

**CAUTION**

The connectors may grow warm during operation and they may become hot depending on the ambient temperature and the conditions of use. Risk of burn to the hands!

- Wear safety gloves when plugging and disconnecting the connectors in the case of a high ambient temperature.
Plugging Procedure

**NOTICE**

Inappropriate handling when plugging or disconnecting may damage the connectors. The functional safety of the connectors is no longer guaranteed when parts are damaged.

- Make sure that the slots (1) and guideways (2) of receptacle and plug always interlock when plugging *(Fig. 19)*!
- Take care that plug and receptacle do not tilt and that they are plugged without force.
- Make sure before the plugging procedure that plug and receptacle as well as the hinged lid of the receptacle are not contaminated. Remove any existing dirt.
- Make sure that when not mated,
  - the plug is always inserted into a dummy receptacle,
  - the hinged lid of receptacles is closed according to its intended use.
- Open the hinged lid of the receptacle by an angle of at least 110° but not more than 130° (refer to *Fig. 20*). Overstretching of the hinged lid may shorten the operational life span of the torsion spring and may damage the hinge mechanism.
- Always close the hinged lid by hand, don’t let it slam!

---

**Note:**

In case of a very low or very high ambient temperature which approximates the limits of the allowable operating temperature range specified in our catalogue *F120.en* in section “Specifications”,
- a higher effort may be needed for the plugging and unplugging and
- the operational life span of plug and coupling receptacle may thus be reduced due to increased wear and tear.

![Diagram of Plugging Procedure](image-url)
6.1 Plugging

- Open the hinged lid (3) of the coupling receptacle (4).
  In doing so, observe the opening angle:
  - at least 110°
  - but not more than 130°

- Position the plug (5) in such a way that the arrow (6) on the plug is congruent with the arrow (7) on the hinged lid of the coupling receptacle (4).

Then insert the plug in such a way that the guideways (2) in the plug slide without much effort into the slots (1) of the receptacle (refer to Fig. 19).
In doing so, take care
- that plug and receptacle are aligned axially (a plug set diagonally by more than 8° cannot be plugged by hand anymore!),
- that the plug is completely (flush) inserted in the receptacle.

- After that close the hinged lid (3) by hand until the locking mechanism (8) on lid and plug latches.

6.2 Unplugging

- Open the hinged lid (3) of the coupling receptacle (4). In doing so, observe the opening angle:
  - at least 110°
  - but not more than 130°

- Hold the hinged lid (3) and take off the plug (5) from receptacle (4). Only pull on the plug, not on the cable.

- Close the hinged lid (3) by hand until the locking mechanism (9) on lid and receptacle shell latches.
7. Maintenance

Note the expert knowledge which is essential for carrying out maintenance work, mentioned in chapter „2. General and Security Information“.

![DANGER]

The connectors contain components that carry voltage. Risk of electric shock!
Always observe the following safety regulations before beginning any work on electrical constructions:
- Disconnect
- Ensure that it is not possible to reconnect unintentionally
- Clearly mark your work area
- Make sure that there is no voltage present
- Earth and short circuit the installation
- Insulate or cover adjacent energized parts
- Only an electrically skilled person may determine if there is no voltage present

All of the maintenance activities that may be carried out on the connectors by skilled personnel are listed below.

7.1 Intervals for Checks and Maintenance

The condition of the connectors depends on environmental influences as well as proper use. To ensure the correct function and a prolonged operational life span of the connectors, the following checks and maintenance must be performed regularly.

<table>
<thead>
<tr>
<th>Checks / Maintenance</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual inspection of</td>
<td></td>
</tr>
<tr>
<td>- plug</td>
<td>At every plugging</td>
</tr>
<tr>
<td>- coupling receptacle</td>
<td></td>
</tr>
<tr>
<td>- receptacle lid</td>
<td></td>
</tr>
<tr>
<td>- cable</td>
<td></td>
</tr>
<tr>
<td>- contacts (in plug and receptacle)</td>
<td></td>
</tr>
<tr>
<td>- contact inserts (in plug and receptacle)</td>
<td></td>
</tr>
<tr>
<td>- strain relief fitting</td>
<td></td>
</tr>
<tr>
<td>- dummy receptacle with socket insert without contacts</td>
<td></td>
</tr>
<tr>
<td>Complete maintenance, where all parts of the connectors are checked for damage and correct function</td>
<td>Every 35 to 42 days</td>
</tr>
</tbody>
</table>

7.2 Visual and Functional Inspection at each Plugging

At every plug-in, all elements of the connector must be visually and functionally inspected.

**NOTICE**

The functional reliability of the connector is no longer given should there be any visible damage to the cable, plug, receptacle housing, hinged lid, contacts, contact inserts, seals or to any other components of the connectors.

- Immediately replace all damaged parts.

7.3 Visual and Functional Inspection/Maintenance of Coupling Receptacle and Dummy Receptacle

In addition to the visual inspection at every plugging, a complete maintenance, where all parts of the connectors are checked for damages and correct function, must be performed every 35 to 42 days.
<table>
<thead>
<tr>
<th>Connector element</th>
<th>Visual and functional inspection</th>
<th>Measures</th>
</tr>
</thead>
</table>
| Receptacle shell and receptacle lid | Check for:  
- low spring tension when opening the receptacle lid  
- ease of movement when plugging  
- dirt  
- damage or wear and tear on shell, contacts, contact insert  
- bent contacts  
- damage or abrasion of slots/guideways  
- cracks and ruptured patches  
- loose or missing fastening elements  
- tears and porosity in the lid seal | In case of defects:  
- remove existent dirt without leaving any residue  
- immediately replace damaged parts |
| Torsion springs at receptacle lid | Check for:  
- insufficient lubrication of torsion springs  
- broken or overstretched torsion springs  
- secure and firm fit of torsion springs | In case of defects:  
- lubricate torsion springs with Molykote  
- immediately replace damaged parts |
| Locking mechanism of the receptacle lid | Close the receptacle lid until the locking mechanism latches and check for:  
- damage or abrasion  
- free movement of the locking mechanism  
- proper operation of the locking mechanism  
- secure and firm fit of the locking mechanism | In case of defects:  
- immediately replace damaged parts |
| Sealing ring (O-ring) on the mounting flange of the receptacle | Check for:  
- tears and porosity on the sealing ring (O-Ring)  
- proper fit of the sealing ring (O-Ring) | In case of defects:  
- immediately replace damaged O-rings |
| Rubber seal (lamella ring) in the receptacle shell | Check for:  
- tears and porosity on the rubber seal (lamella ring)  
- proper fit of the rubber seal (lamella ring) |  
- Immediately replace a damaged rubber seal (lamella ring) |
| Socket insert (for receptacles) | Check for:  
- visible damage  
- dirt  
- signs of moisture  
- cracks and ruptured patches  
- tears and porosity on the sealing ring (O-Ring) | In case of defects:  
- remove existent dirt or moisture without leaving any residue  
- immediately replace damaged parts |
| Replacement insert/ Crimp adapter | Check for:  
- visible damage  
- dirt  
- signs of moisture  
- cracks and ruptured patches  
- tears and porosity on the sealing ring (O-Ring) | In case of defects:  
- remove existent dirt or moisture without leaving any residue  
- immediately replace damaged parts |
| Socket contacts | Check for:  
- visible damage  
- dirt  
- signs of moisture  
- pushed back contacts  
- a loose fit of the contacts in the socket insert | In case of defects:  
- remove existent dirt or moisture without leaving any residue  
- immediately replace damaged parts |
7.4 Visual and Functional Inspection/Maintenance of the Cable Plug

8. Special Tools

- Pull off tool UIC-DWZ for pulling off the crimp adapter from the replacement insert (ordering code UIC-DWZ)

![Pull off tool UIC-DWZ](Fig. 24: Pull off tool UIC-DWZ)

- Extraction tool AWZ-B for contacts type H: SHC-x, BHC-x (ordering code AWZ-B)

![ Extraction tool AWZ-B](Fig. 25: Extraction tool AWZ-B)

- Crimping tool CWZ-600-1 for connection cross sections 0.14 mm\(^2\) ... 6 mm\(^2\) (ordering code CWZ-600-1)

![Crimp tool CWZ-600-1](Fig. 26: Crimp tool CWZ-600-1)

**NOTICE**

Only crimping tools authorised by Schaltbau GmbH may be used.

10. Technical Data

Specifications and information on the material characteristics for the connectors in the UIC 558 series are given in our catalogue F120.en. Due to our continuous improvement programme, the design of our products can be modified at any time. So some features may differ from the descriptions, specifications and drawings in the catalogue. You can download the latest update of the catalogue at: schaltbau.info/download1en. The updated catalogue renders the previous issue invalid.
Electrical Components and Systems for
Railway Engineering and Industrial Applications

Connectors
- Connectors manufactured to industry standards
- Connectors to suit the special requirements of communications engineering (MIL connectors)
- Charging connectors for battery-powered machines and systems
- Connectors for railway engineering, including UIC connectors
- Special connectors to suit customer requirements

Snap-action switches
- Snap-action switches with positive opening operation
- Snap-action switches with self-cleaning contacts
- Enabling switches
- Special switches to suit customer requirements

Contactors
- Single and multi-pole DC contactors
- High-voltage AC/DC contactors
- Contactors for battery powered vehicles and power supplies
- Contactors for railway applications
- Terminal bolts and fuse holders
- DC emergency disconnect switches
- Special contactors to suit customer requirements

Electrics for rolling stock
- Equipment for driver's cab
- Equipment for passenger use
- High-voltage switchgear
- High-voltage heaters
- High-voltage roof equipment
- Equipment for electric brakes
- Design and engineering of train electrics to customer requirements
